a)

$$E_1 = E_0 \cos(kr - \omega t)$$

$$E_2 = E_0 \cos(k(r + d \sin(\alpha)) - \omega t)$$

$$\begin{aligned} E &= E_1 + E_2 = E_0 \cos(kr - \omega t) + E_0 \cos(k(r + d \sin(\alpha)) - \omega t) = \\ &= \underbrace{2E_0 \cos\left(\frac{1}{2}kd \sin(\alpha)\right)}_{:= A} \cos\left(kr - \omega t + \frac{1}{2}kd \sin(\alpha)\right) \end{aligned}$$

$$I \propto A^2$$

$$I(\alpha) = \underline{\underline{I_0 \cos^2\left(\frac{d\pi}{\lambda} \sin(\alpha)\right)}}$$

b) $E = 10 \text{ eV}; \quad d = 3 \text{ nm}$

$$I(\alpha) = 0$$

$$\frac{d\pi}{\lambda} \sin(\alpha) = \frac{\pi}{2}$$

$$\alpha = \arcsin\left(\frac{\lambda}{2d}\right) = \arcsin\left(\frac{h}{2d\sqrt{2Em_e}}\right) = \underline{\underline{3.71^\circ}}$$

c) The probability of finding a single electron at the first minima is zero because destructive interference is happening. If you close one slit, no interference happens and you have a gaussian distribution centered on the remaining slit.
